

CONTENTS

Introduction	XXI
1. The Magic of Quantum Mechanics	1
1.1 History of a revolution	4
1.2 Postulates	15
1.3 The Heisenberg uncertainty principle	34
1.4 The Copenhagen interpretation	37
1.5 How to disprove the Heisenberg principle? The Einstein–Podolsky–Rosen recipe	38
1.6 Is the world real?	40
Bilocation	40
1.7 The Bell inequality will decide	43
1.8 Intriguing results of experiments with photons	46
1.9 Teleportation	47
1.10 Quantum computing	49
2. The Schrödinger Equation	55
2.1 Symmetry of the Hamiltonian and its consequences	57
2.1.1 The non-relativistic Hamiltonian and conservation laws	57
2.1.2 Invariance with respect to translation	61
2.1.3 Invariance with respect to rotation	63
2.1.4 Invariance with respect to permutation of identical particles (fermions and bosons)	64
2.1.5 Invariance of the total charge	64
2.1.6 Fundamental and less fundamental invariances	65
2.1.7 Invariance with respect to inversion – parity	65
2.1.8 Invariance with respect to charge conjugation	68
2.1.9 Invariance with respect to the symmetry of the nuclear framework	68
2.1.10 Conservation of total spin	69
2.1.11 Indices of spectroscopic states	69
2.2 Schrödinger equation for stationary states	70
2.2.1 Wave functions of class Q	73
2.2.2 Boundary conditions	73
2.2.3 An analogy	75

2.2.4	Mathematical and physical solutions	76
2.3	The time-dependent Schrödinger equation	76
2.3.1	Evolution in time	77
2.3.2	Normalization is preserved	78
2.3.3	The mean value of the Hamiltonian is preserved	78
2.3.4	Linearity	79
2.4	Evolution after switching a perturbation	79
2.4.1	The two-state model	81
2.4.2	First-order perturbation theory	82
2.4.3	Time-independent perturbation and the Fermi golden rule	83
2.4.4	The most important case: periodic perturbation	84
3.	Beyond the Schrödinger Equation	90
3.1	A glimpse of classical relativity theory	93
3.1.1	The vanishing of apparent forces	93
3.1.2	The Galilean transformation	96
3.1.3	The Michelson–Morley experiment	96
3.1.4	The Galilean transformation crashes	98
3.1.5	The Lorentz transformation	100
3.1.6	New law of adding velocities	102
3.1.7	The Minkowski space-time continuum	104
3.1.8	How do we get $E = mc^2$?	106
3.2	Reconciling relativity and quantum mechanics	109
3.3	The Dirac equation	111
3.3.1	The Dirac electronic sea	111
3.3.2	The Dirac equations for electron and positron	115
3.3.3	Spinors and bispinors	115
3.3.4	What next?	117
3.3.5	Large and small components of the bispinor	117
3.3.6	How to avoid drowning in the Dirac sea	118
3.3.7	From Dirac to Schrödinger – how to derive the non-relativistic Hamiltonian?	119
3.3.8	How does the spin appear?	120
3.3.9	Simple questions	122
3.4	The hydrogen-like atom in Dirac theory	123
3.4.1	Step by step: calculation of the ground state of the hydrogen-like atom within Dirac theory	123
3.4.2	Relativistic contraction of orbitals	128
3.5	Larger systems	129
3.6	Beyond the Dirac equation.	130
3.6.1	The Breit equation	130
3.6.2	A few words about quantum electrodynamics (QED)	132
4.	Exact Solutions – Our Beacons	142
4.1	Free particle	144
4.2	Particle in a box	145
4.2.1	Box with ends	145
4.2.2	Cyclic box	149

4.2.3	Comparison of two boxes: hexatriene and benzene	152
4.3	Tunnelling effect	153
4.3.1	A single barrier	153
4.3.2	The magic of two barriers...	158
4.4	The harmonic oscillator	164
4.5	Morse oscillator	169
4.5.1	Morse potential	169
4.5.2	Solution	170
4.5.3	Comparison with the harmonic oscillator	172
4.5.4	The isotope effect	172
4.5.5	Bond weakening effect	174
4.5.6	Examples	174
4.6	Rigid rotator	176
4.7	Hydrogen-like atom	178
4.8	Harmonic helium atom (harmonium)	185
4.9	What do all these solutions have in common?	188
4.10	Beacons and pearls of physics	189
5.	Two Fundamental Approximate Methods	195
5.1	Variational method	196
5.1.1	Variational principle	196
5.1.2	Variational parameters	200
5.1.3	Ritz Method	202
5.2	Perturbational method	203
5.2.1	Rayleigh–Schrödinger approach	203
5.2.2	Hylleraas variational principle	208
5.2.3	Hylleraas equation	209
5.2.4	Convergence of the perturbational series	210
6.	Separation of Electronic and Nuclear Motions	217
6.1	Separation of the centre-of-mass motion	221
6.1.1	Space-fixed coordinate system (SFCS)	221
6.1.2	New coordinates	221
6.1.3	Hamiltonian in the new coordinates	222
6.1.4	After separation of the centre-of-mass motion	224
6.2	Exact (non-adiabatic) theory	224
6.3	Adiabatic approximation	227
6.4	Born–Oppenheimer approximation	229
6.5	Oscillations of a rotating molecule	229
6.5.1	One more analogy	232
6.5.2	The fundamental character of the adiabatic approximation – PES	233
6.6	Basic principles of electronic, vibrational and rotational spectroscopy	235
6.6.1	Vibrational structure	235
6.6.2	Rotational structure	236
6.7	Approximate separation of rotations and vibrations	238
6.8	Polyatomic molecule	241
6.8.1	Kinetic energy expression	241
6.8.2	Simplifying using Eckart conditions	243

6.8.3	Approximation: decoupling of rotation and vibrations	244
6.8.4	The kinetic energy operators of translation, rotation and vibrations	245
6.8.5	Separation of translational, rotational and vibrational motions	246
6.9	Non-bound states	247
6.10	Adiabatic, diabatic and non-adiabatic approaches	252
6.11	Crossing of potential energy curves for diatomics	255
6.11.1	The non-crossing rule	255
6.11.2	Simulating the harpooning effect in the NaCl molecule	257
6.12	Polyatomic molecules and conical intersection	260
6.12.1	Conical intersection	262
6.12.2	Berry phase	264
6.13	Beyond the adiabatic approximation...	268
6.13.1	Muon catalyzed nuclear fusion	268
6.13.2	“Russian dolls” – or a molecule within molecule	270
7.	Motion of Nuclei	275
7.1	Rovibrational spectra – an example of accurate calculations: atom – diatomic molecule	278
7.1.1	Coordinate system and Hamiltonian	279
7.1.2	Anisotropy of the potential V	280
7.1.3	Adding the angular momenta in quantum mechanics	281
7.1.4	Application of the Ritz method	282
7.1.5	Calculation of rovibrational spectra	283
7.2	Force fields (FF)	284
7.3	Local Molecular Mechanics (MM)	290
7.3.1	Bonds that cannot break	290
7.3.2	Bonds that can break	291
7.4	Global molecular mechanics	292
7.4.1	Multiple minima catastrophe	292
7.4.2	Is it the global minimum which counts?	293
7.5	Small amplitude harmonic motion – normal modes	294
7.5.1	Theory of normal modes	295
7.5.2	Zero-vibration energy	303
7.6	Molecular Dynamics (MD)	304
7.6.1	The MD idea	304
7.6.2	What does MD offer us?	306
7.6.3	What to worry about?	307
7.6.4	MD of non-equilibrium processes	308
7.6.5	Quantum-classical MD	308
7.7	Simulated annealing	309
7.8	Langevin Dynamics	310
7.9	Monte Carlo Dynamics	311
7.10	Car–Parrinello dynamics	314
7.11	Cellular automata	317
8.	Electronic Motion in the Mean Field: Atoms and Molecules	324
8.1	Hartree–Fock method – a bird’s eye view	329
8.1.1	Spinorbitals	329

8.1.2	Variables	330
8.1.3	Slater determinants	332
8.1.4	What is the Hartree–Fock method all about?	333
8.2	The Fock equation for optimal spinorbitals	334
8.2.1	Dirac and Coulomb notations	334
8.2.2	Energy functional	334
8.2.3	The search for the conditional extremum	335
8.2.4	A Slater determinant and a unitary transformation	338
8.2.5	Invariance of the \hat{J} and \hat{K} operators	339
8.2.6	Diagonalization of the Lagrange multipliers matrix	340
8.2.7	The Fock equation for optimal spinorbitals (General Hartree–Fock method – GHF)	341
8.2.8	The closed-shell systems and the Restricted Hartree–Fock (RHF) method	342
8.2.9	Iterative procedure for computing molecular orbitals: the Self-Consistent Field method	350
8.3	Total energy in the Hartree–Fock method	351
8.4	Computational technique: atomic orbitals as building blocks of the molecular wave function	354
8.4.1	Centring of the atomic orbital	354
8.4.2	Slater-type orbitals (STO)	355
8.4.3	Gaussian-type orbitals (GTO)	357
8.4.4	Linear Combination of Atomic Orbitals (LCAO) Method	360
8.4.5	Basis sets of Atomic Orbitals	363
8.4.6	The Hartree–Fock–Roothaan method (SCF LCAO MO)	364
8.4.7	Practical problems in the SCF LCAO MO method	366
	RESULTS OF THE HARTREE–FOCK METHOD	369
8.5	Back to foundations...	369
8.5.1	When does the RHF method fail?	369
8.5.2	Fukutome classes	372
8.6	Mendeleev Periodic Table of Chemical Elements	379
8.6.1	Similar to the hydrogen atom – the orbital model of atom	379
8.6.2	Yet there are differences...	380
8.7	The nature of the chemical bond	383
8.7.1	H_2^+ in the MO picture	384
8.7.2	Can we see a chemical bond?	388
8.8	Excitation energy, ionization potential, and electron affinity (RHF approach)	389
8.8.1	Approximate energies of electronic states	389
8.8.2	Singlet or triplet excitation?	391
8.8.3	Hund’s rule	392
8.8.4	Ionization potential and electron affinity (Koopmans rule)	393
8.9	Localization of molecular orbitals within the RHF method	396
8.9.1	The external localization methods	397
8.9.2	The internal localization methods	398
8.9.3	Examples of localization	400
8.9.4	Computational technique	401
8.9.5	The σ , π , δ bonds	403
8.9.6	Electron pair dimensions and the foundations of chemistry	404
8.9.7	Hybridization	407

8.10 A minimal model of a molecule	417
8.10.1 Valence Shell Electron Pair Repulsion (VSEPR)	419
9. Electronic Motion in the Mean Field: Periodic Systems	428
9.1 Primitive lattice	431
9.2 Wave vector	433
9.3 Inverse lattice	436
9.4 First Brillouin Zone (FBZ)	438
9.5 Properties of the FBZ	438
9.6 A few words on Bloch functions	439
9.6.1 Waves in 1D	439
9.6.2 Waves in 2D	442
9.7 The infinite crystal as a limit of a cyclic system	445
9.8 A triple role of the wave vector	448
9.9 Band structure	449
9.9.1 Born–von Kármán boundary condition in 3D	449
9.9.2 Crystal orbitals from Bloch functions (LCAO CO method)	450
9.9.3 SCF LCAO CO equations	452
9.9.4 Band structure and band width	453
9.9.5 Fermi level and energy gap: insulators, semiconductors and metals	454
9.10 Solid state quantum chemistry	460
9.10.1 Why do some bands go up?	460
9.10.2 Why do some bands go down?	462
9.10.3 Why do some bands stay constant?	462
9.10.4 How can more complex behaviour be explained?	462
9.11 The Hartree–Fock method for crystals	468
9.11.1 Secular equation	468
9.11.2 Integration in the FBZ	471
9.11.3 Fock matrix elements	472
9.11.4 Iterative procedure	474
9.11.5 Total energy	474
9.12 Long-range interaction problem	475
9.12.1 Fock matrix corrections	476
9.12.2 Total energy corrections	477
9.12.3 Multipole expansion applied to the Fock matrix	479
9.12.4 Multipole expansion applied to the total energy	483
9.13 Back to the exchange term	485
9.14 Choice of unit cell	488
9.14.1 Field compensation method	490
9.14.2 The symmetry of subsystem choice	492
10. Correlation of the Electronic Motions	498
VARIATIONAL METHODS USING EXPLICITLY CORRELATED WAVE FUNCTION	502
10.1 Correlation cusp condition	503
10.2 The Hylleraas function	506
10.3 The Hylleraas CI method	506
10.4 The harmonic helium atom	507

10.5	James–Coolidge and Kołos–Wolniewicz functions	508
10.5.1	Neutrino mass	511
10.6	Method of exponentially correlated Gaussian functions	513
10.7	Coulomb hole (“correlation hole”)	513
10.8	Exchange hole (“Fermi hole”)	516
	VARIATIONAL METHODS WITH SLATER DETERMINANTS	520
10.9	Valence bond (VB) method	520
10.9.1	Resonance theory – hydrogen molecule	520
10.9.2	Resonance theory – polyatomic case	523
10.10	Configuration interaction (CI) method	525
10.10.1	Brillouin theorem	527
10.10.2	Convergence of the CI expansion	527
10.10.3	Example of H ₂ O	528
10.10.4	Which excitations are most important?	529
10.10.5	Natural orbitals (NO)	531
10.10.6	Size consistency	532
10.11	Direct CI method	533
10.12	Multireference CI method	533
10.13	Multiconfigurational Self-Consistent Field method (MC SCF)	535
10.13.1	Classical MC SCF approach	535
10.13.2	Unitary MC SCF method	536
10.13.3	Complete active space method (CAS SCF)	538
	NON-VARIATIONAL METHODS WITH SLATER DETERMINANTS	539
10.14	Coupled cluster (CC) method	539
10.14.1	Wave and cluster operators	540
10.14.2	Relationship between CI and CC methods	542
10.14.3	Solution of the CC equations	543
10.14.4	Example: CC with double excitations	545
10.14.5	Size consistency of the CC method	547
10.15	Equation-of-motion method (EOM-CC)	548
10.15.1	Similarity transformation	548
10.15.2	Derivation of the EOM-CC equations	549
10.16	Many body perturbation theory (MBPT)	551
10.16.1	Unperturbed Hamiltonian	551
10.16.2	Perturbation theory – slightly different approach	552
10.16.3	Reduced resolvent or the “almost” inverse of $(E_0^{(0)} - \hat{H}^{(0)})$	553
10.16.4	MBPT machinery	555
10.16.5	Brillouin–Wigner perturbation theory	556
10.16.6	Rayleigh–Schrödinger perturbation theory	557
10.17	Møller–Plesset version of Rayleigh–Schrödinger perturbation theory	558
10.17.1	Expression for MP2 energy	558
10.17.2	Convergence of the Møller–Plesset perturbation series	559
10.17.3	Special status of double excitations	560
11.	Electronic Motion: Density Functional Theory (DFT)	567
11.1	Electronic density – the superstar	569
11.2	Bader analysis	571
11.2.1	Overall shape of ρ	571

11.2.2	Critical points	571
11.2.3	Laplacian of the electronic density as a “magnifying glass”	575
11.3	Two important Hohenberg–Kohn theorems	579
11.3.1	Equivalence of the electronic wave function and electron density	579
11.3.2	Existence of an energy functional minimized by ρ_0	580
11.4	The Kohn–Sham equations	584
11.4.1	The Kohn–Sham system of non-interacting electrons	584
11.4.2	Total energy expression	585
11.4.3	Derivation of the Kohn–Sham equations	586
11.5	What to take as the DFT exchange–correlation energy E_{xc} ?	590
11.5.1	Local density approximation (LDA)	590
11.5.2	Non-local approximations (NLDA)	591
11.5.3	The approximate character of the DFT vs apparent rigour of <i>ab initio</i> computations	592
11.6	On the physical justification for the exchange correlation energy	592
11.6.1	The electron pair distribution function	592
11.6.2	The quasi-static connection of two important systems	594
11.6.3	Exchange–correlation energy vs Π_{aver}	596
11.6.4	Electron holes	597
11.6.5	Physical boundary conditions for holes	598
11.6.6	Exchange and correlation holes	599
11.6.7	Physical grounds for the DFT approximations	601
11.7	Reflections on the DFT success	602
12.	The Molecule in an Electric or Magnetic Field	615
12.1	Hellmann–Feynman theorem	618
	ELECTRIC PHENOMENA	620
12.2	The molecule immobilized in an electric field	620
12.2.1	The electric field as a perturbation	621
12.2.2	The homogeneous electric field	627
12.2.3	The inhomogeneous electric field: multipole polarizabilities and hyperpolarizabilities	632
12.3	How to calculate the dipole moment	633
12.3.1	Hartree–Fock approximation	633
12.3.2	Atomic and bond dipoles	634
12.3.3	Within the ZDO approximation	635
12.4	How to calculate the dipole polarizability	635
12.4.1	Sum Over States Method	635
12.4.2	Finite field method	639
12.4.3	What is going on at higher electric fields	644
12.5	A molecule in an oscillating electric field	645
	MAGNETIC PHENOMENA	647
12.6	Magnetic dipole moments of elementary particles	648
12.6.1	Electron	648
12.6.2	Nucleus	649
12.6.3	Dipole moment in the field	650
12.7	Transitions between the nuclear spin quantum states – NMR technique	652
12.8	Hamiltonian of the system in the electromagnetic field	653

12.8.1	Choice of the vector and scalar potentials	654
12.8.2	Refinement of the Hamiltonian	654
12.9	Effective NMR Hamiltonian	658
12.9.1	Signal averaging	658
12.9.2	Empirical Hamiltonian	659
12.9.3	Nuclear spin energy levels	664
12.10	The Ramsey theory of the NMR chemical shift	666
12.10.1	Shielding constants	667
12.10.2	Diamagnetic and paramagnetic contributions	668
12.11	The Ramsey theory of NMR spin–spin coupling constants	668
12.11.1	Diamagnetic contributions	669
12.11.2	Paramagnetic contributions	670
12.11.3	Coupling constants	671
12.11.4	The Fermi contact coupling mechanism	672
12.12	Gauge invariant atomic orbitals (GIAO)	673
12.12.1	London orbitals	673
12.12.2	Integrals are invariant	674

14.5	Acceptor–donor (AD) theory of chemical reactions	798
14.5.1	Maps of the molecular electrostatic potential	798
14.5.2	Where does the barrier come from?	803
14.5.3	MO, AD and VB formalisms	803
14.5.4	Reaction stages	806
14.5.5	Contributions of the structures as reaction proceeds	811
14.5.6	Nucleophilic attack $\text{H}^- + \text{ETHYLENE} \rightarrow \text{ETHYLENE} + \text{H}^-$. .	816
14.5.7	Electrophilic attack $\text{H}^+ + \text{H}_2 \rightarrow \text{H}_2 + \text{H}^+$	818

14.5.8	Nucleophilic attack on the polarized chemical bond in the VB picture	818
14.5.9	What is going on in the chemist's flask?	821
14.5.10	Role of symmetry	822
14.5.11	Barrier means a cost of opening the closed-shells	826
14.6	Barrier for the electron-transfer reaction	828
14.6.1	Diabatic and adiabatic potential	828
14.6.2	Marcus theory	830
15.	Information Processing – the Mission of Chemistry	848
15.1	Complex systems	852
15.2	Self-organizing complex systems	853
15.3	Cooperative interactions	854
15.4	Sensitivity analysis	855
15.5	Combinatorial chemistry – molecular libraries	855
15.6	Non-linearity	857
15.7	Attractors	858
15.8	Limit cycles	859
15.9	Bifurcations and chaos	860
15.10	Catastrophes	862
15.11	Collective phenomena	863
15.11.1	Scale symmetry (renormalization)	863
15.11.2	Fractals	865
15.12	Chemical feedback – non-linear chemical dynamics	866
15.12.1	Brusselator – dissipative structures	868
15.12.2	Hypercycles	873
15.13	Functions and their space-time organization	875
15.14	The measure of information	875
15.15	The mission of chemistry	877
15.16	Molecular computers based on synthon interactions	878
APPENDICES		887
A. A REMAINDER: MATRICES AND DETERMINANTS		889
1.	Matrices	889
2.	Determinants	892
B. A FEW WORDS ON SPACES, VECTORS AND FUNCTIONS		895
1.	Vector space	895
2.	Euclidean space	896
3.	Unitary space	897
4.	Hilbert space	898
5.	Eigenvalue equation	900
C. GROUP THEORY IN SPECTROSCOPY		903
1.	Group	903
2.	Representations	913

3. Group theory and quantum mechanics	924
4. Integrals important in spectroscopy	929
D. A TWO-STATE MODEL	948
E. DIRAC DELTA FUNCTION	951
1. Approximations to $\delta(x)$	951
2. Properties of $\delta(x)$	953
3. An application of the Dirac delta function	953
F. TRANSLATION vs MOMENTUM and ROTATION vs ANGULAR MOMENTUM	955
1. The form of the \hat{U} operator	955
2. The Hamiltonian commutes with the total momentum operator	957
3. The Hamiltonian, \hat{J}^2 and \hat{J}_z do commute	958
4. Rotation and translation operators do not commute	960
5. Conclusion	960
G. VECTOR AND SCALAR POTENTIALS	962
H. OPTIMAL WAVE FUNCTION FOR A HYDROGEN-LIKE ATOM	969
I. SPACE- AND BODY-FIXED COORDINATE SYSTEMS	971
J. ORTHOGONALIZATION	977
1. Schmidt orthogonalization	977
2. Löwdin symmetric orthogonalization	978
K. DIAGONALIZATION OF A MATRIX	982
L. SECULAR EQUATION $(H - \epsilon S)c = 0$	984
M. SLATER-CONDON RULES	986
N. LAGRANGE MULTIPLIERS METHOD	997
O. PENALTY FUNCTION METHOD	1001
P. MOLECULAR INTEGRALS WITH GAUSSIAN TYPE ORBITALS 1s	1004
Q. SINGLET AND TRIPLET STATES FOR TWO ELECTRONS	1006

R. THE HYDROGEN MOLECULAR ION IN THE SIMPLEST ATOMIC BASIS SET	1009
S. POPULATION ANALYSIS	1015
T. THE DIPOLE MOMENT OF A LONE ELECTRON PAIR	1020
U. SECOND QUANTIZATION	1023
V. THE HYDROGEN ATOM IN THE ELECTRIC FIELD – VARIATIONAL APPROACH	1029
W. NMR SHIELDING AND COUPLING CONSTANTS – DERIVATION	1032
1. Shielding constants	1032
2. Coupling constants	1035
X. MULTIPOLE EXPANSION	1038
Y. PAULI DEFORMATION	1050
Z. ACCEPTOR–DONOR STRUCTURE CONTRIBUTIONS IN THE MO CONFIGURATION	1058
Name Index	1065
Subject Index	1077
